Start with the lab. Connect the business.

Standard is a connected business platform. Metrology is its first industry edition, built around the work of calibration laboratories.

The problem at the handoff

An instrument can pass calibration and still wait on review, a customer answer, a certificate or a shipment. The laboratory needs the technical evidence and the operating context together: the result, the next owner, the promise, the invoice and the cost of delivering the service.

The product thesis

Connect measurement records to the surrounding business. Standard brings calibration and uncertainty, quality management, smart documents, customer access, logistics and accounting into the same platform. Workflow authoring and Sigma reporting make the process and its history available for inspection.

A defined initial customer

Independent calibration businesses and multi-site laboratory networks. Founder-led outreach and workflow demonstrations focus the first adoption conversations on the lab's equipment, source records, documents and difficult handoffs.

Founder and company

MetraSlate LLC is based in Portsmouth, Virginia. Its founder comes from calibration and metrology and is a US Navy veteran. The company is bootstrapped and beginning its funding journey.

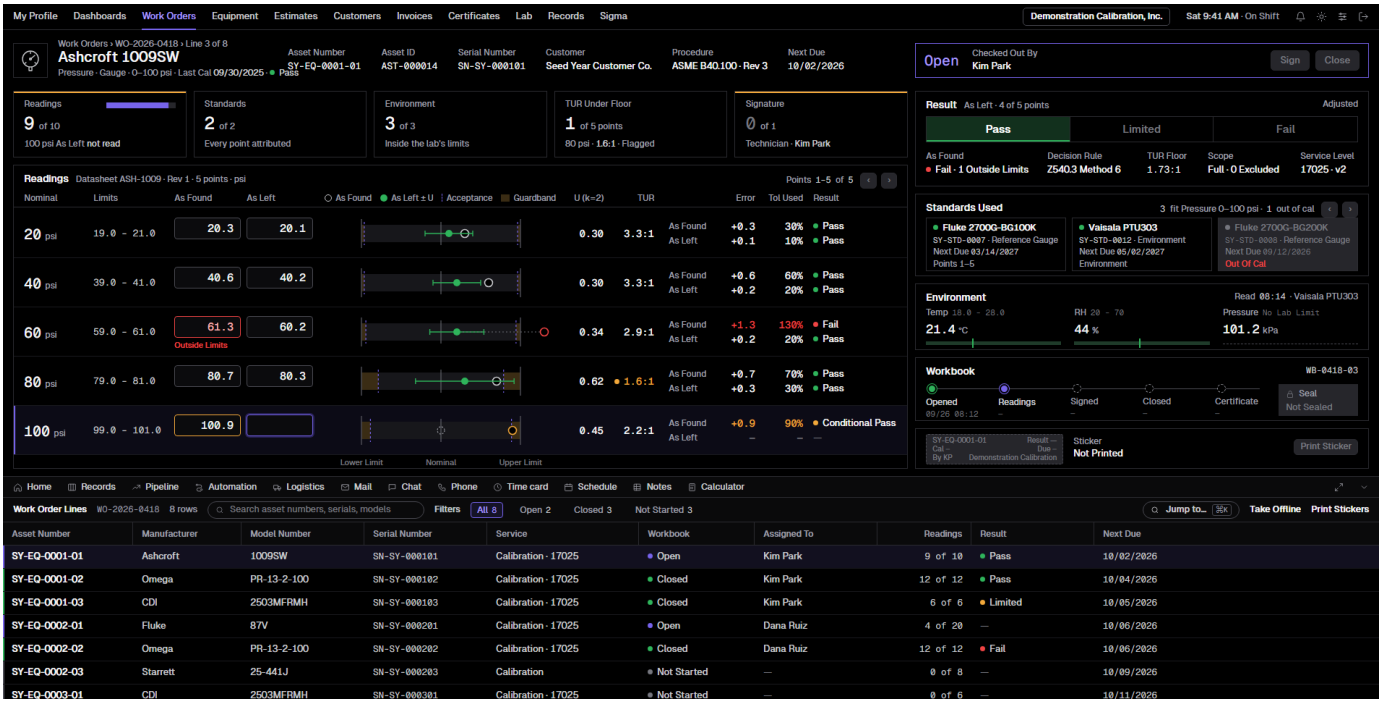

How the business earns

Monthly software terms for independent businesses and enterprise terms for multi-site networks. Migration and onboarding are scoped around the customer's records and operating needs.

Watch the product overview | Explore the workspaces

The measurement. The evidence. The business around it.

Explore the product in detail, then discuss adoption, commercial progress and the next milestones.

Calibration workspace with illustrative sample data. Full screen and work-order register retained.

A technical and operational foundation

Structured readings, uncertainty, standards attribution and decision rules support the measurement. Frozen calibration records preserve the recorded basis; corrections retain their predecessor. Root-cause analysis, corrective actions and versioned certificate templates connect the result to quality work.

Priorities for investment

Customer onboarding and migration, production operations, product validation and a repeatable sales process. Funding discussions should connect the amount raised to delivery milestones, paid adoption and the resources needed to support customers.
