METRASLATE

INVESTOR BRIEF / OCTOBER 2026

Enterprise equipment software. Built to run the business.

Asset provides the general equipment and business foundation. Standard develops that foundation for an industry. Metrology provides the first concrete market focus.

The investment proposition is connected operating software: customer work, equipment, technical evidence, purchasing and financial records in one product family. Commercial validation must prove adoption and repeatable delivery.

ASSET LIGHT

01 / BUYER AND PROBLEM

Sell the complete operating job, not another isolated register.

The initial Standard buyer is a calibration laboratory. Its service crosses commercial, physical, technical and financial work. Separate tools make the handoffs expensive to understand and maintain.

The laboratory owner	Needs to understand open work, customer commitments, operating problems and money owed. The buying decision includes implementation burden and the ability to run the business.
Operations and customer service	Need to identify received instruments, current custody, work progress, overdue promises and customer decisions. They need the underlying records, not a disconnected dashboard.
Technical and quality roles	Need structured calibration work, applicable reference records, review and released documents. General business software alone does not supply this industry process.
Finance and purchasing	Need the estimate, customer purchase order, purchased materials or outside services, invoice, receipts and credits to remain understandable alongside the job.
Equipment owners	Represent the broader Asset opportunity: organizations across industries managing equipment and the operations around it. Asset Light addresses buyers seeking the fleet-management portion alone.

The product hypothesis

Keeping these records connected can reduce repeated entry and the need to reconstruct a job across systems. Customer demonstrations and subsequent operating use should establish the value in turnaround, administrative effort, visibility and service quality.

Competitive buying context

Prospects may retain laboratory software, customize an ERP, combine asset and accounting systems, or continue with spreadsheets. A convincing demonstration must show both a better operating fit and a credible transition.

02 / PRODUCT STRATEGY

One foundation. A broad product and a focused entry market.

Asset and Standard are related products, not competing feature bundles. Industry specialization is the distinction. The Metrology Edition provides a specific workflow to demonstrate and sell.

Asset	Industry-independent asset management plus general business operations: customer work, purchasing and inventory, people, invoices and finance around equipment. It is not limited to equipment tracking.
STANDARD BY METRASLATE	The shared Asset foundation developed around the specialized workflows, records and processes of an industry. It is intended to become the operating standard for that industry.
Metrology Edition	Calibration laboratory specialization: estimates and work orders connect to receipt, structured calibration data, technical review, certificates, delivery and invoicing.
Asset Light	Asset management without the wider business operations. A focused private-fleet proposition for equipment owners, distinct from the service laboratory's customer portal.
The portal relationship	The Standard laboratory customer account and its portal share that customer's fleet. Standalone Asset and Light retain private fleets; explicit cross-company service exchange is a separate development track.
Adjacent roadmap	Public Safety is in development and Traceability is in design. Metrologistics and MetraSocial are planned. Analytics and Quality Management are platform capabilities, not assumed standalone revenue lines.

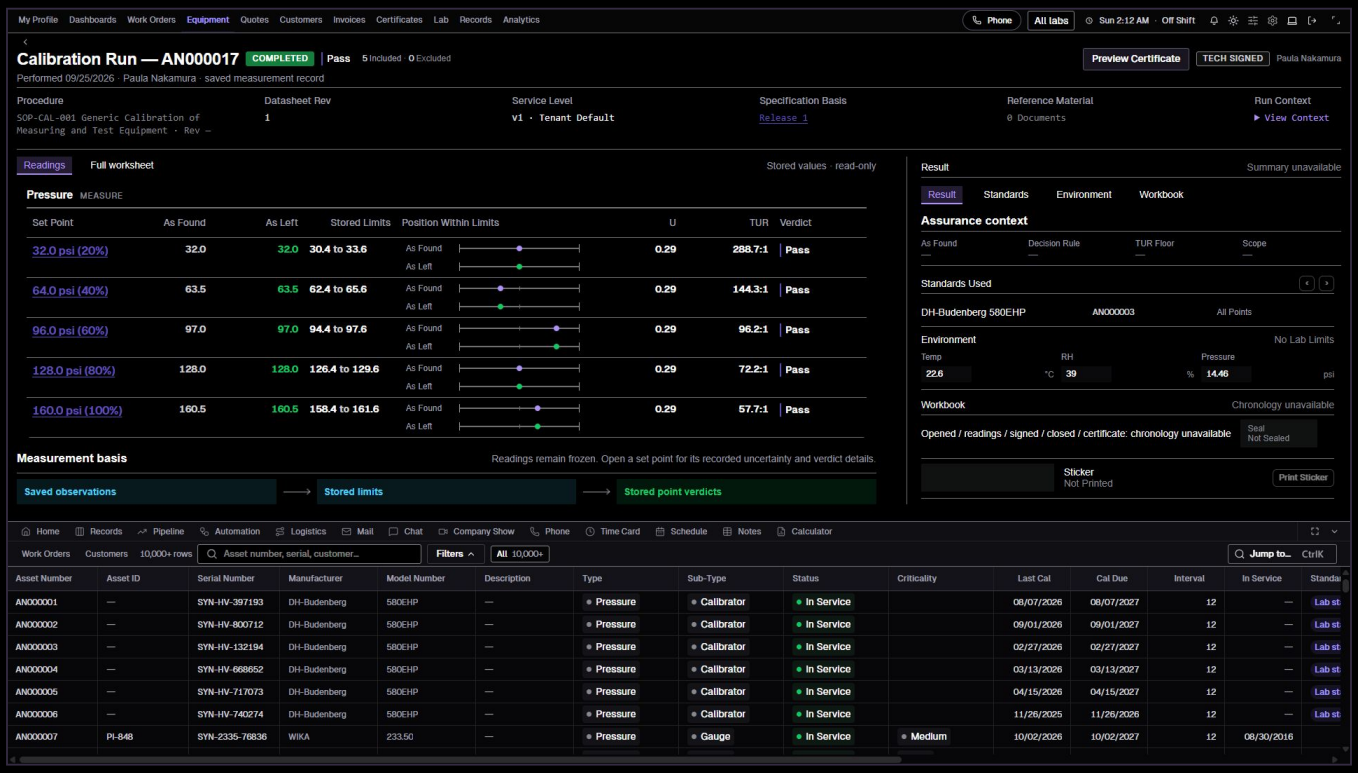

Why this structure matters

A shared foundation can support broader equipment-centered organizations while Standard editions supply the industry depth needed for a specific sale. Reuse is a product strategy; its commercial value depends on reliable deployment and a repeatable implementation method.

03 / PRODUCT EVIDENCE

Demonstrate the work and the business context together.

The Standard demonstration includes the operating records of a calibration laboratory. The useful proof is whether a buyer can follow a real job through the technical and commercial process.

Complete calibration record in the Standard Metrology demo, with sample data. This is actual product imagery, not a conceptual interface. Select the image to expand.

Technical workflow	Identify the instrument, recorded measurement work and result. Reviewers need access to the supporting evidence and document context, rather than only a final status.
Commercial workflow	Follow the same job through customer agreement, custody, exceptions, document release, return and invoice. The connected workflow is the demonstration objective.
Development position	Standard has the broadest demonstrated workflow. Standalone Asset packaging, Asset Light completion and private service exchange remain development and commercialization priorities.

04 / COMMERCIAL MODEL

Enterprise agreements, with implementation scoped explicitly.

The recommended commercial model is sales-led: qualify the organization, demonstrate its workflow, agree its software scope and commercial terms, then implement against a defined acceptance plan.

Recurring software	Negotiate the product and selected capability package around the customer's requirements. Users, locations, hosting and service scope can inform the agreement, with volume and term arrangements agreed per customer.
Customer configuration	The intended operating model is Console-managed provisioning for each customer. The agreed commercial package and feature availability remain distinct from an administrator temporarily switching an operational feature off.
Implementation services	Metra Praxis covers discovery, data migration, configuration and training. Separate this delivery work and its economics from recurring software revenue.
Initial sales motion	Lead with Standard Metrology for a recognizable laboratory problem. Demonstrate a complete job, include a realistic exception, and agree a bounded adoption scope with the buyer.
Expansion	Pursue additional sites and relevant capabilities when justified by customer use. Asset and Asset Light provide related buyer propositions; adoption is not assumed to follow automatically.
Measure account economics	Track signed recurring revenue, one-time implementation effort, infrastructure and provider costs, support demand, retention and expansion. Distinguish pipeline, paid pilots and operating accounts.

Commercial validation to earn

The first milestones are qualified opportunities, signed agreements, successful scoped implementations and sustained paid use. A customer-level operating model should connect contract revenue to the cost of acquisition, onboarding and support.

05 / EXECUTION AND INVESTMENT

Fund a repeatable path from product to operating customers.

The investment case depends on customer demand, delivery economics and operating reliability. The next plan should connect spending to clear evidence of adoption rather than additional breadth alone.

Customer acceptance	Complete representative workflows, including failures, permissions, documents and customer-specific requirements. Obtain acceptance for the agreed operating scope.
Repeatable onboarding	Validate source data, define migration and configuration steps, train each role and measure time to the first completed job. Capture delivery effort and recurring support needs.
Operational readiness	Establish deployment ownership, monitoring, backup and tested recovery, incident response and provider management for the intended hosting arrangement.
Product focus	Prioritize Standard Metrology acceptance and explicit Asset / Asset Light package boundaries. Keep unfinished exchange and adjacent products out of committed customer scope until ready.
Execution risks	Evaluate switching costs, broad product scope, founder concentration, security and technical assurance, infrastructure costs and the effort required for each customer implementation.
Capital discussion	Determine the financing amount and structure against a costed milestone plan. Review capitalization, contracts, current finances and proposed uses of funds in founder-led diligence.

A concrete investor next step

Review a complete Standard workflow, the current product milestone evidence, commercial pipeline and a costed delivery plan. Assess what the proposed capital changes in customer outcomes, operating capacity and runway.
