METRASLATE

PRODUCT OVERVIEW / OCTOBER 2026

Enterprise software for equipment and the business around it.

Asset manages equipment and general business operations. Standard adds the workflows of a specific industry. Asset Light focuses on asset management.

Connect equipment, customers, work, purchasing, people and financial records. Metrology shows how the shared foundation becomes software for running a calibration laboratory.

ASSET LIGHT

01 / CHOOSE THE RIGHT PRODUCT

Three products. One clear relationship.

Choose by the operation you need to run. Asset and Standard share the same business foundation; Standard adds industry specialization, while Asset Light focuses on the equipment lifecycle.

Asset	Industry-independent asset and business management for organizations that own, use, service or manage instrumentation and equipment. Connect equipment to customer work, purchasing, inventory, people, invoices and finance.
STANDARD BY METRASLATE	The Asset foundation developed around a particular industry. Industry editions add specialized workflows, records and processes instead of asking the buyer to assemble an industry solution from generic modules.
Metrology Edition	Standard for calibration laboratories. Connect estimates, receipt and custody to structured calibration work, technical review, certificates, delivery and invoicing.
Asset Light	Focused asset management without the broader business operations. The right starting point when the requirement is equipment records, service dates, history and documents rather than running the whole business.
Customer Portal	Access for customers of a Standard laboratory. The portal and the laboratory customer account share that customer's fleet and related service information. It remains a portal, separate from standalone Asset and Asset Light.

A practical example

A laboratory uses Standard Metrology to provide calibration. A manufacturing company could use Asset to run its equipment-centered business, or Asset Light to manage its fleet. Being a laboratory customer does not make that company's standalone private fleet automatically visible to the laboratory.

02 / ASSET

Run the equipment lifecycle and the surrounding business.

Asset serves organizations working with equipment across industries. Its scope includes the commercial and operating work around the asset, without prescribing how a calibration laboratory must operate.

Equipment identity, service dates and connected records in the shared Standard demo configuration, illustrating the asset-management foundation. Select the image to expand.

Equipment

Identify each unit, maintain manufacturer and model information, locate it by site, and retain service records and documents. Reusable templates give similar units a consistent starting point.

Business operations

Connect customer and supplier records, estimates, work orders, purchasing, inventory, scheduling, personnel, invoices and finance. Asset is more than an equipment register.

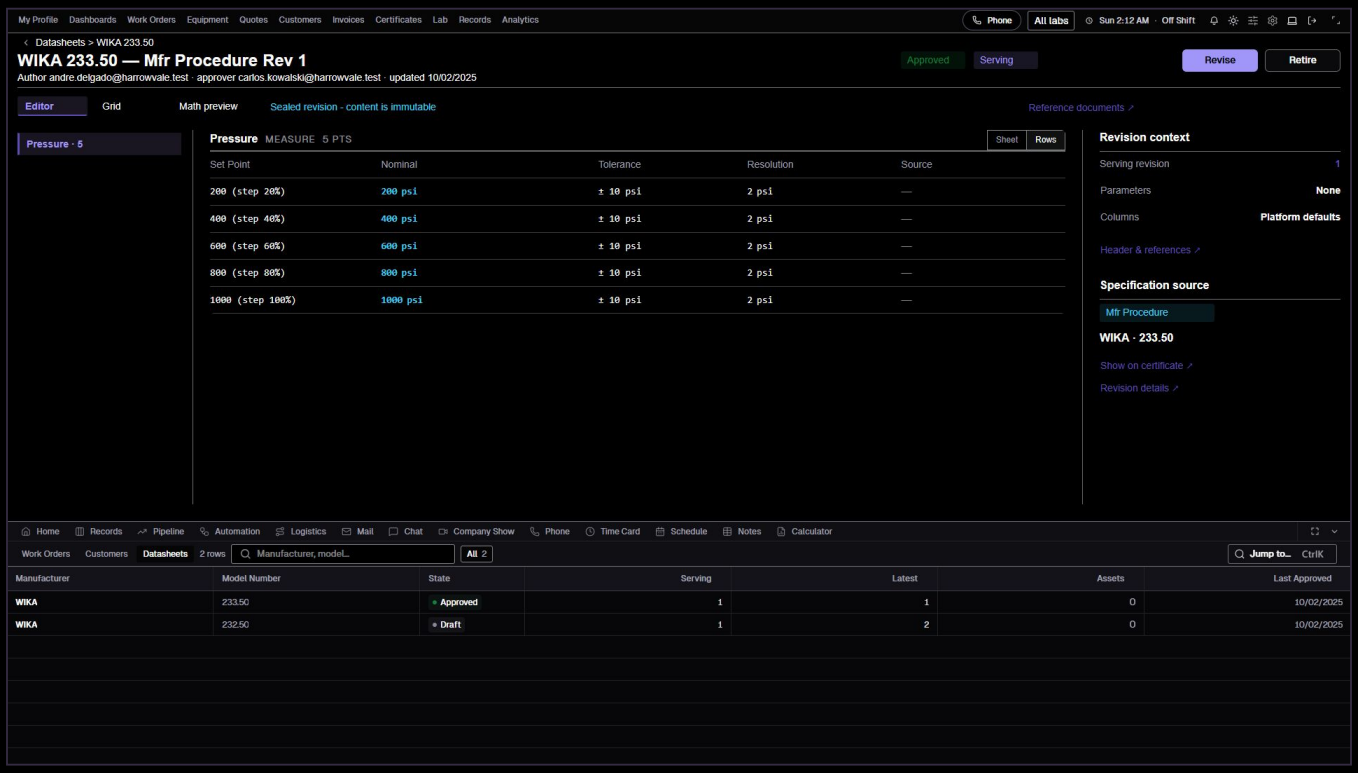

Buyer fit

Choose Asset when you need equipment-centered enterprise software and general business operations, with configuration around your organization rather than a prescribed industry process.

03 / STANDARD METROLOGY

Run a calibration laboratory from request to invoice.

Standard retains Asset's business capabilities and adds the specialized work of an industry. Metrology connects the customer job to the measurement evidence and released document.

Structured calibration datasheet in the Standard Metrology demo. The complete screen preserves the work surface and register context. Select the image to expand.

Prepare	Link the customer's actual instrument, required service, procedure and datasheet. Use equipment and reference-standard records as the basis for the work.
Perform and review	Record measurement points, units, tolerances, applicable uncertainty and results. Keep technical review connected to the work and its supporting evidence.
Release and bill	Issue the required certificate, coordinate the instrument's return, and invoice the agreed work. Specialized technical records remain connected to the commercial job.

04 / AN END-TO-END JOB

Keep the customer, instrument and agreed work connected.

A calibration laboratory sells a service, receives physical equipment, produces technical evidence and collects payment. Standard is designed around that complete job.

1. Agree the work	Record the customer, site, contact and requested services. Prepare an estimate with priced lines and revisions, retain the customer decision, and capture the purchase-order reference.
2. Receive the instruments	Identify what actually arrived and record custody against the order. Show late promises, missing instruments and unresolved decisions so the next action is visible.
3. Perform the service	Complete the required calibration procedure and readings. Track item-level progress and exceptions such as parts, approvals or review; different instruments can progress independently.
4. Review and release	Review the technical result and supporting records. Generate the certificate or other business document from the recorded work and the applicable document template.
5. Return the equipment	Coordinate pickup, shipment or delivery with the instrument and customer context available. Retain the handover and related service documents.
6. Invoice and follow up	Invoice the work, record receipts and credits, and retain the connection to the underlying job. Customer service can answer a question using the same account and work history.

Why the connections matter

The useful result is an answer to a real operating question: what is here, what is late, what is blocked, what was released, or what remains unpaid? Demonstrate those handoffs with your own representative job during the product walkthrough.

05 / ASSET LIGHT AND PORTAL

Manage the fleet. Choose the right relationship.

Asset Light is for the organization managing its own equipment. The customer portal is for the relationship between a Standard laboratory and its customer. They serve different purposes.

Asset Light buyer	An equipment owner or coordinator who needs asset identity, sites, service dates, history and documents, without adopting CRM, purchasing, invoicing and other business operations.
A private asset workspace	Standalone Asset and Asset Light are intended to hold the owner's fleet privately. Creating an asset should not automatically publish it to an outside service provider.
The laboratory portal	The portal and the Standard laboratory's customer account share that customer's asset information. It gives the customer access to its relationship with that laboratory, including work and released documents.
Service exchange direction	For standalone products, the intended service exchange shares the assets selected for service. An asset may be represented in several independent laboratories; this exchange is being developed separately from portal access.
Scope the implementation	Asset Light's exact package boundaries, external service exchange and tool-crib requirements are confirmed during scoping. A walkthrough should use the functions required for the buyer's actual equipment process.

Choose with a concrete requirement

If the job is to manage your fleet, start with Asset Light. If you also need to run general business operations, evaluate Asset. If you provide calibration and need the industry's specialized processes, evaluate Standard Metrology.

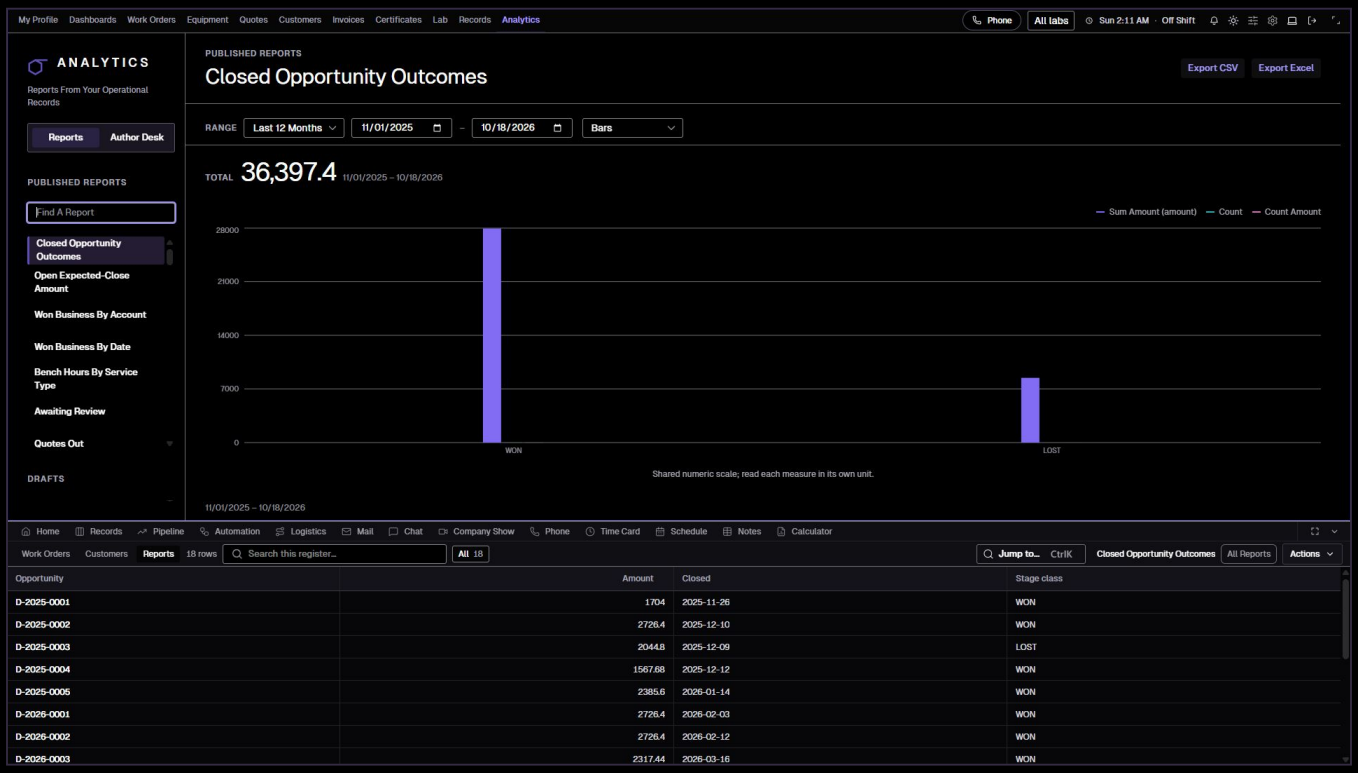

Request a relevant walkthrough

Request a demo with the product, organization size, sites and equipment process you want to discuss.

06 / CONFIGURATION AND ANALYTICS

Make the records useful to the people running the business.

Equipment and business records should support decisions, documents and actions. Analytics, workflow automation and reusable templates form part of the platform capability set.

Analytics report workspace in the Standard demo, showing report selection, period controls, chart and the contributing record register. Select the image to expand.

Analytics

Review operational information with the relevant period, scope and record context. Choose reports around a question such as due work, customer activity or commercial results.

Documents and rules

Reusable document templates and configured workflow actions connect record data to business outputs and follow-up. Roles determine what each person may access and perform.

Enterprise configuration

Scope company structure, responsibilities, required features and external connections around the customer. Agree the package and implementation before rollout.

07 / BUYING AND IMPLEMENTATION

Start with your operation. Agree the package and rollout.

MetraSlate is enterprise software. Product selection and commercial discussions should follow the organization's work, data, users and sites, rather than a generic demonstration.

Product discovery	Identify whether the need is private fleet management, general equipment-centered business operations, or industry-specialized operations. Select Asset Light, Asset or the appropriate Standard edition.
A meaningful demonstration	Bring a representative asset, customer job and exception. Review the complete workflow, the people involved, the documents issued and the records needed afterward.
Commercial scope	Discuss the selected capabilities, users, locations, hosting and implementation. Agree a customer-specific package and commercial terms, including any applicable volume or contract-term arrangements.
Implementation with Praxis	Metra Praxis covers discovery and implementation work: map existing data, scope migration, configure responsibilities and documents, train users and agree acceptance for the selected operating process.
Related development	Public Safety Edition is in development; Traceability Edition is in design. Metrologistics and MetraSocial are planned ecosystem offerings. They are separate from the primary Asset and Standard buying decision.

See the product with your workflow

Request a product walkthrough at metraslate.com/demo. Tell us what equipment you manage, what work you provide, and which handoffs your current systems fail to connect.

What to agree before rollout

Confirm the selected package, required integrations, migration responsibilities, access model and acceptance criteria. Deployment and commercial commitments belong to the agreed customer scope.
