

METRASLATE

MetraSlate | Company Brief

Company and Growth Strategy

Equipment. Customer Work. Technical Records.

THE COMPANY

Manage Equipment and the Business Around It.

MetraSlate connects the equipment record to the people, work and business decisions that give it value.

The first commercial focus is calibration laboratories: businesses where a customer request must stay connected to a technical result and a billable service.

Asset by MetraSlate	General equipment management and business operations: equipment history, customers, work and the records behind the business.
Standard	The Asset foundation developed for industry-specific work. Metrology is the first Standard edition, with calibration methods, measurements, review and certificates.

THE CUSTOMER PROBLEM

A Calibration Job Crosses the Whole Business.

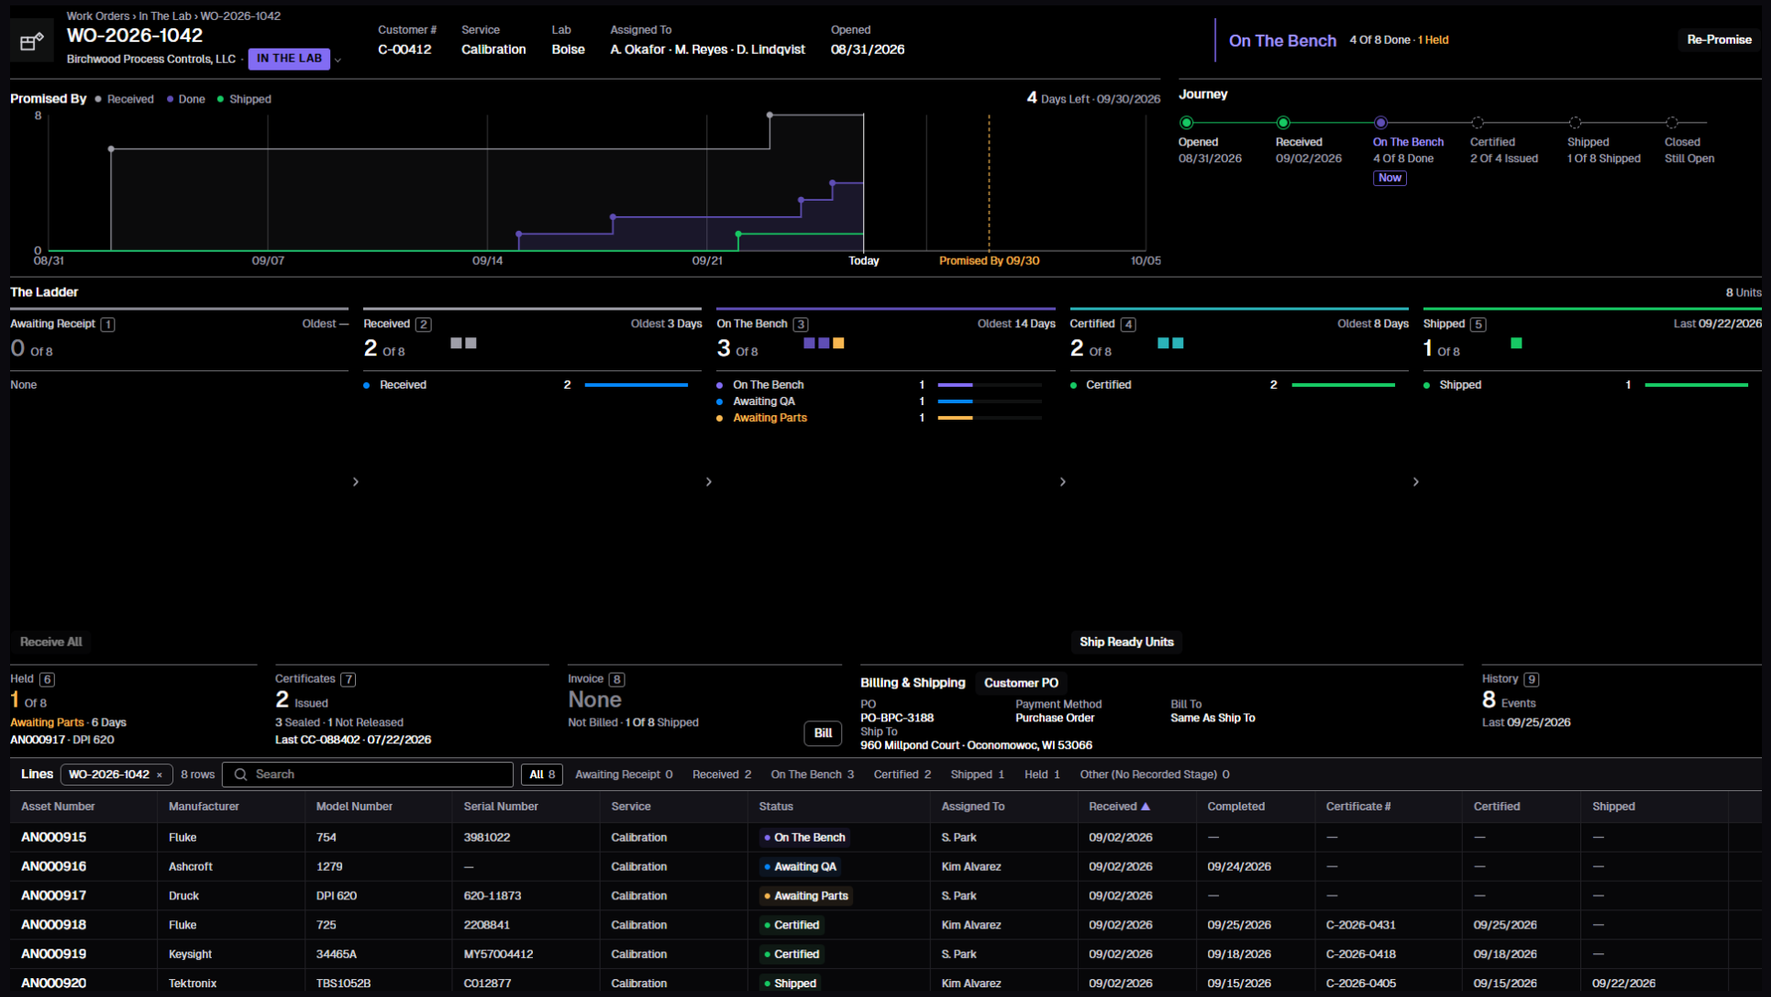

The expensive part of disconnected software is the work people repeat between systems.

Standard brings these records into one operating workflow so the next person can act without reconstructing the job.

Before the Bench	Receive the request, prepare an estimate, identify the incoming equipment and assign the work.
At the Bench	Use an approved template, record measurements and reference standards, and inspect uncertainty and the decision rule.
After the Bench	Review the result, release the certificate, answer the customer and invoice the service.

LABORATORY OPERATIONS

Follow Each Instrument Through the Job

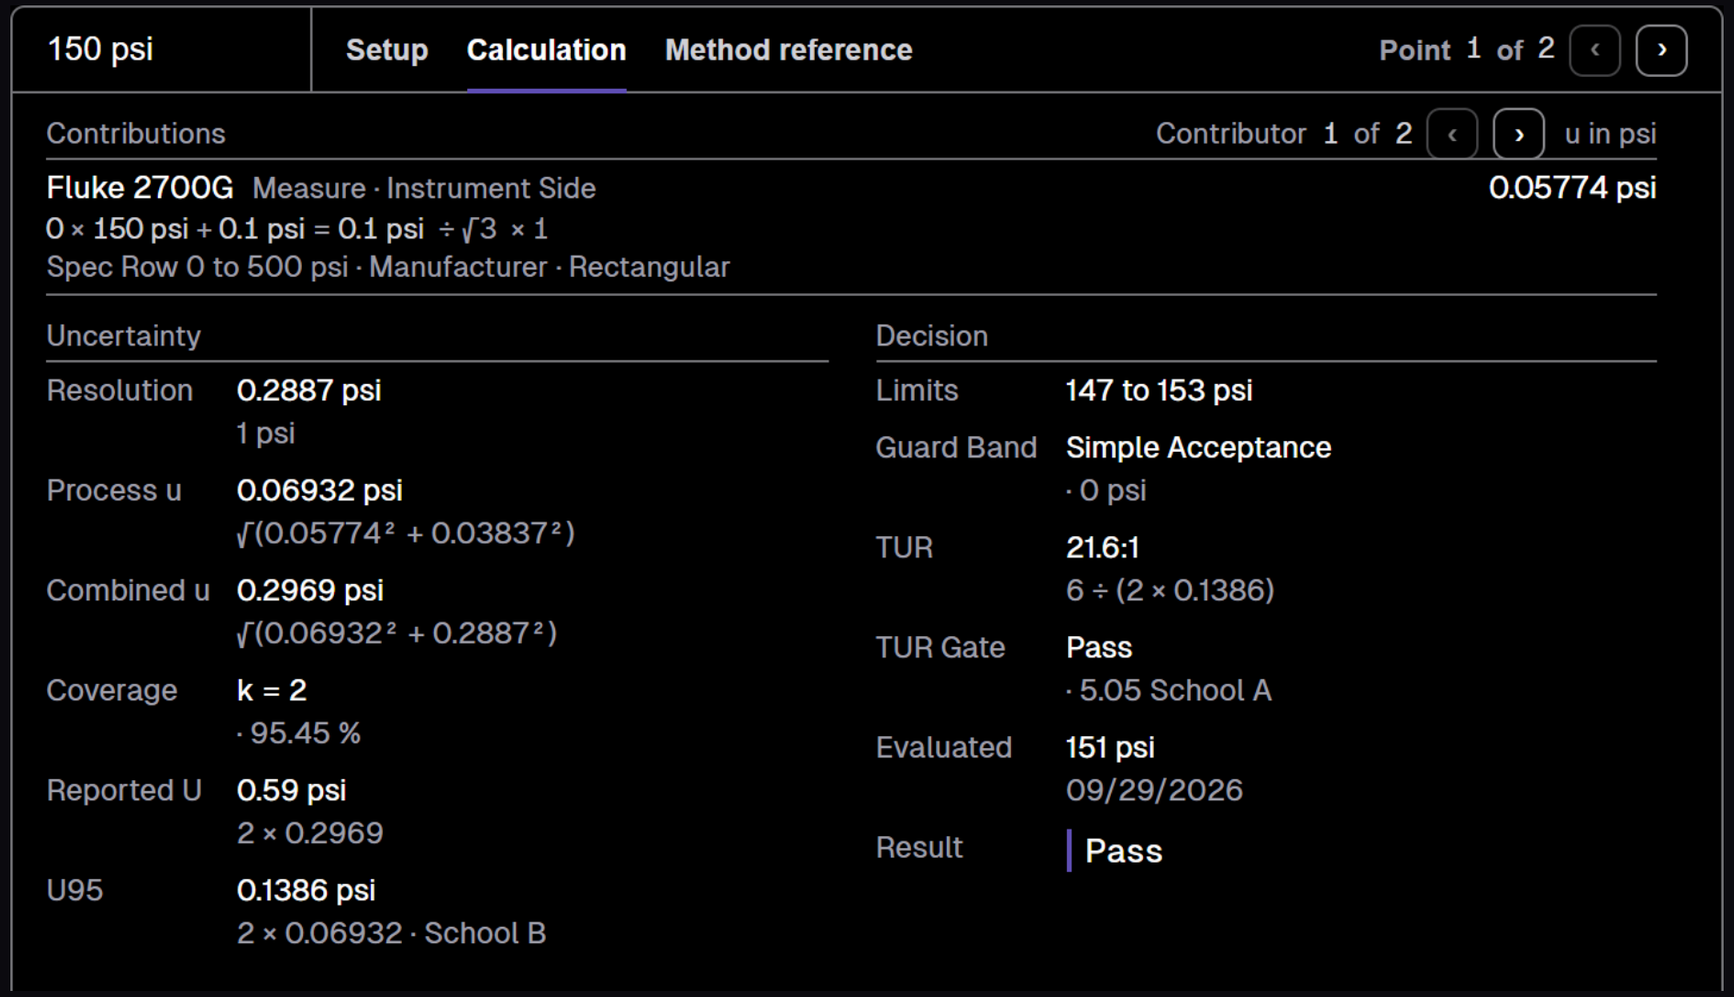

Track individual instruments, assignments, progress and service holds within the same work order.

Demonstration with sample data.

TECHNICAL DEPTH

Keep the Calculation with the Measurement.

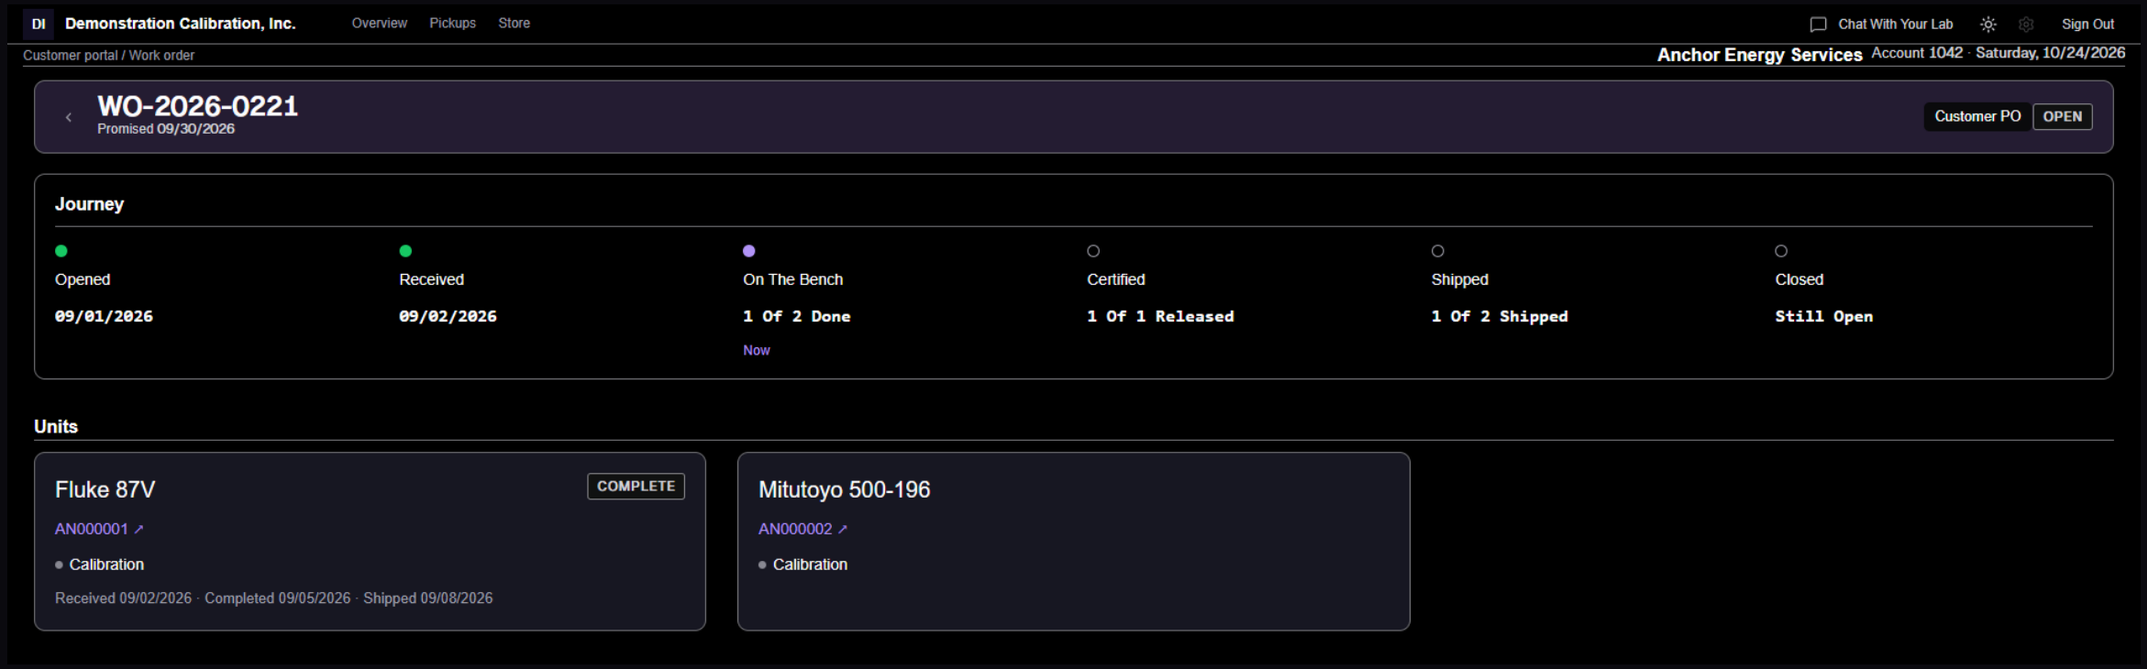

Inspect the uncertainty contributions, limits, TUR and decision rule behind a measured point.

Component preview · sample data.

CUSTOMER SERVICE

Give Customers a View of Their Work.

Let the customer follow instrument progress and identify the decisions the laboratory needs next.

Demonstration with sample data.

COMMERCIAL MODEL

Earn Recurring Use Through Useful Daily Work.

The business model combines software licensing with separately scoped onboarding and migration support.

Invoices, recorded payments and financial reports help explain operating performance. The next costing depth is reliable allocation of labor and overhead to individual jobs.

Software	Match the product and access needs to the customer's operation. Validate the offer through paid adoption.
Implementation	Map the customer's records, configure a representative workflow and train the people responsible for it.
Value	Compare preparation time, repeated entry, technical review, certificate turnaround and ongoing support effort.

CURRENT STAGE

Product Depth Now. Customer Proof Next.

MetraSlate is founder-led and recruiting early customers and pilot partners.

Early Access	Standard demonstrations cover customer requests, work orders, calibration, calculations, review, certificates, portals and business records. Screens use sample data; the selected customer workflow is agreed before rollout.
Next Evidence	Accepted customer workflows, paid use, repeat use, onboarding effort and support cost will establish the commercial case.
In Development	Further job-cost allocation, automated payment collection and proposed external integrations require their own delivery and acceptance.

EXPANSION DIRECTION

Start with the Laboratory. Grow Around Equipment Ownership.

These are distinct growth paths. The immediate priority is proving adoption and delivery in the first market.

Asset by MetraSlate

The broader equipment and business foundation can serve owners beyond the laboratory.

Asset Light

A focused equipment-management offering for owners who need a narrower scope.

Metrologistics - Proposed

A marketplace connecting equipment owners with service providers: discover a provider, request an estimate and arrange service.

Future Standard Editions

Develop industry-specific workflows with operators whose needs extend beyond the general Asset foundation.

START A CONVERSATION

Bring a Real Workflow to the Discussion.

We are looking for laboratory operators, equipment businesses and partners who can help turn useful software into repeatable adoption.

For Operators	Choose a representative job and compare the work, records and output with your current process.
For Partners	Explore a specific customer need, a complementary capability and a practical way to test the fit.
For Investors	Discuss the first market, customer evidence and the capital needed to build a repeatable business.
