

METRASLATE

Standard: Technical and Security Overview

Pilot / Early Access

Equipment. Customer Work. Technical Records.

ARCHITECTURE

Follow the Record Through Its Lifecycle

Equipment, measurements, approvals and financial records retain their own meaning as work moves between people.

Equipment and Definition

Equipment keeps its identity. Approved model, method and datasheet definitions provide a reusable technical basis.

Run and Evaluation

The run connects observations, reference standards and calculation policy. Completion retains the basis used for that result.

Review and Release

Reviewed content and rendering identities connect the approval to the issued document and any later correction.

Commercial Records

Quotation revisions, approvals, invoices, receipts and journal entries retain the agreement and financial outcome.

IDENTITY AND ACCESS

Authorize the Person, Company and Action

Verify these boundaries with the actual companies, roles and records selected for the deployment.

Identity

WorkOS-backed organizational identity supports the configured sign-in and enterprise administration. Application membership and permissions determine business access.

Company Scope

Tenant data access requires company context. Database row policies constrain company records; a lab or regional view does not replace authorization.

Record Authority

Roles and privileges govern relevant read, edit, approval and release actions. Internal conversation membership and record access are checked separately.

Customer Portal

Contacts reach the customer account, permitted sites and released information allowed by their binding.

RETAINED EVIDENCE

Keep the Basis of a Decision Retrievable

Measurement Basis

Retain the instrument, method, phase, units, observations, attributed standards, technical revisions and calculation evidence.

Review Basis

Certificate review records the identities of the reviewed payload, template, assets and rendering basis. A material change returns the affected approval for review.

Correction Lineage

Amendment, reseal and withdrawal retain the earlier record and reason. Earlier evidence remains distinguishable from the successor.

Configured Authority

Signatory and reviewer checks apply when configured. Confirm the required roles, separation of duties and permitted, recorded overrides for the deployment.

NUMERICAL CONTROLS

Use a Defined Model for Each Result

Contribution-Based Evaluation

Resolve supported contributions with units, sensitivity and distribution treatment. Apply coverage, reporting precision, TUR and decision policy.

Incomplete Inputs

Missing standards or unresolved contributions produce refusal or report-of-value handling, according to the applicable path and policy.

Retained Calculation

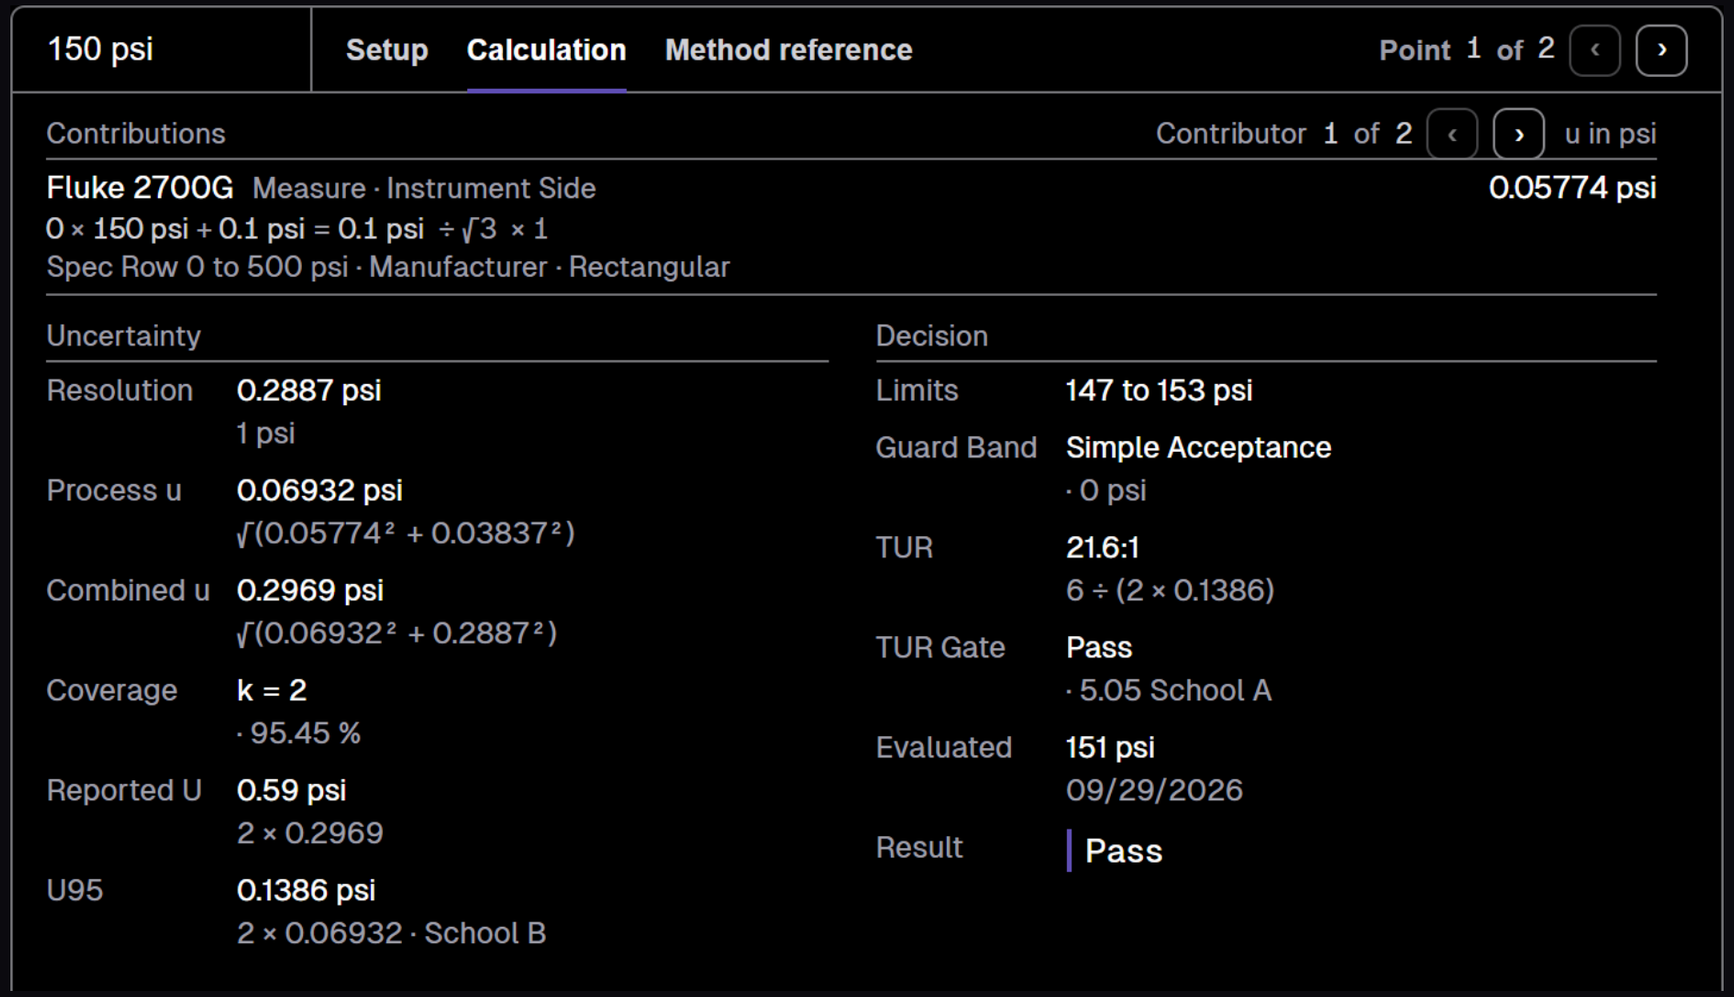

Keep the working expanded uncertainty distinct from its reported value. Retain limits, guardband, acceptance interval and the resulting decision.

Method Limits

General covariance propagation, authored repeated-observation completion and a complete MSA suite are outside the validated scope described here.

CALCULATION EVIDENCE

Inspect the Inputs Alongside the Decision

Inspect the recorded point's contributions and decision policy together, then use an accepted example to verify values, units, coverage, limits and retained evidence.

Component preview · sample data.

CMC AND TECHNICAL PUBLICATION

Publish a Curve With Its Supporting Budget

Formal reviewer approval is a separate requirement to confirm for scope publication.

Budget

Low- and high-point contributors retain values, units, sensitivity, distribution, coverage and degrees of freedom.

Compute

Combine uncorrelated contributions, apply supported fixed or Student-t coverage, and fit the gain-plus-offset curve through published endpoint values.

Publish

Scope publication checks the supporting calculation and revision context. The catalog curve retains its budget relationship and coverage.

Separate Responsibilities

The browser calculator stores its own drafts and saved results locally. Controlled scope publication is a separate workflow, and accreditation approval remains external.

FINANCIAL CONTROLS

Keep the Agreement and Account Reconciled

Accepted Terms

Quotation approval checks the offered revision, items and policy. Portal approval attributes the decision to the bound contact.

Invoice Basis

Guarded invoice paths check the accepted basis and duplicate active invoices. Include overrides and legacy paths in deployment acceptance.

Receipts and Statements

Recorded receipts and credits affect balances. Financial statements derive from posted journal movements and require complete posting, mapping and reconciliation.

Cost Meaning

Run duration, labor-span events and posted costs describe different facts. Full labor-rate, reference and overhead allocation for automatic job margin remains in development.

EXTERNAL CONNECTIONS

Define the Exchange and Its Failure Cases

Ownership

Specify the authoritative record, company identity, stable identifiers, units, method revision, mapping version and expected response.

Credentials

Integration credentials use tenant-bound authenticated encryption and key versions. Administrative summaries expose identifying metadata rather than plaintext secrets.

Delivery and Correction

Exercise duplicate input, missing data, conflicting revisions, interruption, rejection, retry and correction. Retain processing outcomes.

Provider Acceptance

Validate the selected identity, mail, payment, execution or accounting connection in its intended configuration. A provider name alone does not establish an accepted exchange.

DEPLOYMENT RESPONSIBILITIES

Name Who Operates and Protects the Service

These are deployment decisions to document with MetraSlate. This guide makes no security-certification, penetration-test, recovery-time or universal compliance claim.

Hosting and Access

Agree the environment, identity setup, company boundaries, administrative access and responsibility for connection credentials.

Recovery and Retention

Define backup ownership, retention, restore targets and a restore exercise using representative records and attachments.

Support and Change

Assign monitoring, updates, incident response, escalation and support responsibilities.

Migration and Exit

New-equipment import is distinct from full historical migration. Define record relationships, attachments, export formats and assistance.

CURRENT SCOPE AND ACCEPTANCE

Accept One Complete Workflow, Including Failures

Pilot / Early Access. The controls described here are implementation evidence; deployment acceptance uses the selected build, configuration and actual roles.

Prepare	Name users, permissions, representative records and expected outcomes. Screens in this guide use sample data.
Exercise	Follow request, accepted terms, equipment, measurement, review, release, invoice and balance. Challenge denied access, stale revisions, missing evidence and repeated submissions.
Retain	Record outcomes and unresolved requirements. Confirm independent Asset service-sharing boundaries, provider exchanges and operating responsibilities before use.

Automated customer payment collection remains in development. A ready QuickBooks connector is not offered.
