METRASLATE

INVESTOR BRIEF / OCTOBER 2026

Build the business software around the work itself.

MetraSlate | Detailed investor brief | October 2026

Standard connects the commercial, technical and financial work of a business. Its first industry edition serves calibration laboratories. Asset combines asset management with end-to-end business operations. Asset Light provides asset management without those business operations.

CUSTOMER ACCOUNT / STANDARD

Monthly recall planning, sites and connected customer records. Actual application capture with sample data.

STANDARD **ASSET** **ASSET LIGHT**

01 / CUSTOMER PROBLEM

The difficult work is between departments.

A laboratory can complete a measurement while the overall job is still waiting on a customer decision, technical review, document release, shipment or payment. Those handoffs are a business problem as well as a technical one.

A concrete buying problem

Consider a group of instruments sent for calibration. Sales agrees the scope and price. Receiving identifies what actually arrived. Technicians perform the work. Reviewers authorize the result. The office releases documents and arranges return. Finance issues the invoice and follows up on payment. An exception at any point needs to remain connected to the right customer, instrument and agreed work.

When systems are separate	Teams reconcile customer identities, equipment numbers, status, prices and documents across applications or spreadsheets. People ask each other for context that should already be attached to the job.
What the buyer needs	A clear account of what was requested, received, performed, reviewed, delivered and billed. The buyer also needs ownership of exceptions and a reliable history of decisions.
Why calibration first	The work combines equipment identity, measurement evidence, quality controls, customer service and commercial operations. These requirements provide a specific setting in which connected business software can demonstrate its value.

The initial buying group

The owner or executive cares about operating control and economics. The laboratory manager cares about throughput and workload. Quality leadership cares about evidence and controlled release. Technicians need an effective work surface. Finance and customer service need the same underlying facts without becoming calibration specialists.

The product opportunity: make the full job understandable and actionable across these roles. A successful deployment reduces the need to reconstruct the same job in multiple systems; the economic benefit must be measured in customer use.

02 / PRODUCT

One job, from the accepted estimate to the books.

Standard is end-to-end business software. The Metrology Edition adds the specialized records and calculations needed by calibration laboratories.

Commercial work	Lead and opportunity records, line-level estimates, revisions and customer approval connect to work orders. The agreed scope remains associated with the work that is delivered.
Technical work	Equipment identity, structured datasheets, readings, reference standards, uncertainty and decision rules support the calibration. Review and release connect the evidence to the issued document.
Quality and documents	Nonconformance, disposition and corrective action have owners and history. Versioned document templates produce certificates and other documents from operational records.
Business operations	Custody, logistics, purchasing, inventory and rentals connect the physical activity to the customer and job. Invoices, receipts, credits and accounting records carry the commercial outcome forward.
Customer participation	A customer portal gives customers access to their own equipment, requests, estimates, work progress and released documents. It connects customer actions to the office's records.
Configuration and analysis	Workflow automation, document templates, roles and Sigma reporting adapt the operation and make its records available for action and investigation.

Where the differentiation must be demonstrated

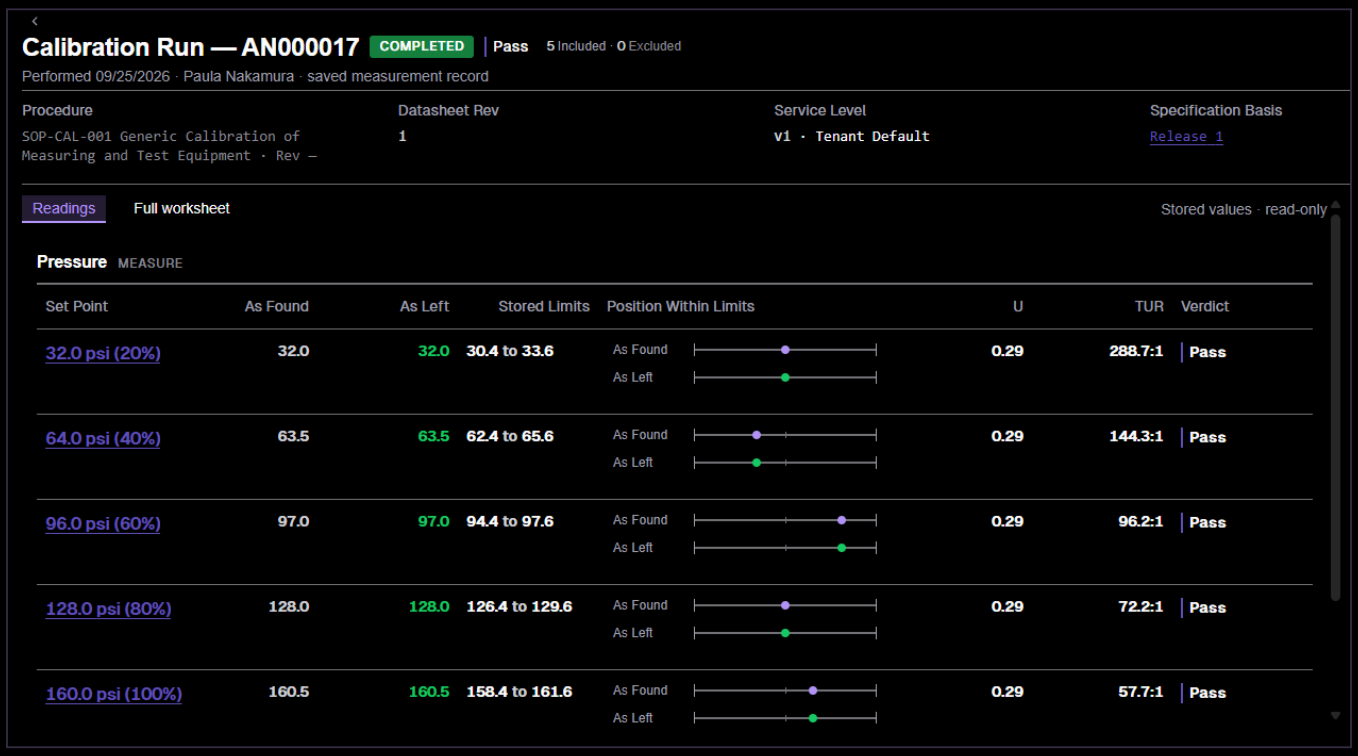

The proposition is the connection between technical evidence and the surrounding business. A laboratory buyer should be able to follow an instrument through pricing, custody, calibration, review, document release and invoice without losing its identity or history. That complete workflow is more meaningful than a count of modules or screens.

Standard is supported by a tenant-scoped application and database design. Technical and security diligence should examine the implemented controls and operating evidence directly; architecture descriptions are not substitutes for an independent assessment.

IN THE PRODUCT / CALIBRATION

Read the measurement. Keep its context.

The calibration record connects each measurement point to the instrument and its result. Technical evidence remains useful after the bench work is complete.

Completed calibration record, readings detail. The capture shows set points, as-found and as-left values, position within stored limits, uncertainty and verdicts. Sample data.

Instrument and procedure

The heading identifies the instrument and completed run. The procedure and datasheet revision provide the recorded basis for the measurement work.

Readings and decisions

The technician and reviewer can examine individual points rather than relying only on a final pass result. Each row preserves the values associated with that point.

Connected documentation

The completed record is the source for technical review and the resulting certificate. Supporting standards and environmental context belong to the same calibration.

03 / PRODUCT FAMILY

A focused entry market. A broader product strategy.

The first commercial focus is calibration laboratories. The broader product family addresses equipment owners, their service relationships and the people who work in those industries.

Standard	The end-to-end business platform. Industry editions adapt specialist records, terminology and work to a shared operational foundation. Metrology is the first edition; other editions are expansion work.
Asset	Asset management and end-to-end business management software. The asset lifecycle provides the starting point: equipment identity, location, service and history connect to work, customers, purchasing, people and finances.
Asset Light	Asset management without business operations. Equipment owners manage asset records, locations, custody, maintenance and calibration due dates, service history and documents. CRM, invoicing and accounting remain outside its scope.
Metrologistics	Planned marketplace for equipment and services. Equipment owners specify a need, discover suitable providers, request and compare quotes, then agree a service, rental or equipment purchase.
MetraSocial	Planned professional community. People build profiles, find peers, participate in relevant conversations and publish practical resources. Shared knowledge becomes useful beyond a single discussion.

Sequence the expansion

Each adjacent product needs its own user need and adoption case. A service marketplace must demonstrate useful supply and demand; a professional community must demonstrate participation and moderation. Neither should be treated as an established network effect or included as current recurring revenue.

Near-term discipline: win the operational workflow first. Use customer evidence to decide which asset-management, marketplace or community capabilities should receive the next investment.

04 / BUSINESS MODEL

Sell operating software. Make onboarding repeatable.

MetraSlate's current commercial approach is monthly software terms for independent businesses and enterprise terms for multi-site organizations, with migration and onboarding scoped to the customer.

Independent businesses	Offer a clear software package aligned to the company's operation. The buying decision should explain the included workflow, implementation responsibilities, support and recurring cost.
Multi-site organizations	Scope organizational structure, roles, data migration, deployment, support and commercial terms across the network. Enterprise adoption requires more than access to a larger number of screens.
Implementation	Assess the source records, import and validate data, configure documents and workflows, and train the relevant roles. A repeatable implementation method is essential to both customer success and delivery economics.
Expansion	Grow through additional sites, relevant capabilities and related product adoption when the customer has a demonstrated need. Package and price those expansions explicitly.
Future marketplace	Metrologistics may support a separate transaction business model. The fee model and operating obligations belong to future marketplace validation, rather than the base software revenue case.

Measure the economics from actual accounts

The operating model should track recurring software revenue, implementation effort, infrastructure and provider costs, support demand, retention and expansion by customer cohort. Separate one-time onboarding revenue from recurring revenue. Enterprise contract value should be supported by signed agreements rather than target price ranges.

A measurable growth model

The immediate objective is paid adoption in the initial market, followed by retention and expansion within those accounts. A customer-level model connects contract revenue to the effort and cost of acquiring, onboarding and supporting that customer. This creates a practical basis for deciding when to expand sales capacity, pursue larger networks or invest in adjacent products.

05 / GO TO MARKET

Demonstrate the hard handoff. Earn the first operating account.

Founder-led outreach begins with a recognizable laboratory workflow. The sales process should establish operational fit, implementation effort and a clear path to paid use.

1. Qualify the problem	Identify laboratories whose current workflow creates specific reconciliation, review, service or billing problems. Record the buyer, decision process, existing systems and the cost of switching.
2. Show a complete job	Demonstrate a request through estimate, receipt, calibration, review, certificate, delivery and invoice. Include an exception that matters to the prospective customer.
3. Scope adoption	Map customer records, equipment, procedures, certificates, access and external connections. Agree the part of the operation that can be introduced safely and measured clearly.
4. Convert to paid use	Agree commercial terms, responsibilities and acceptance criteria. Distinguish a conversation, a demonstration, a signed pilot and a paying operating account in the pipeline.
5. Establish a repeatable method	Record migration effort, time to first completed job, support demand and the customer's reasons for adopting. Use that evidence to improve the next implementation.
6. Expand from results	Pursue additional sites or related customers once the implementation supports real work. Use references and case studies only with the customer's agreement.

Competitive alternatives

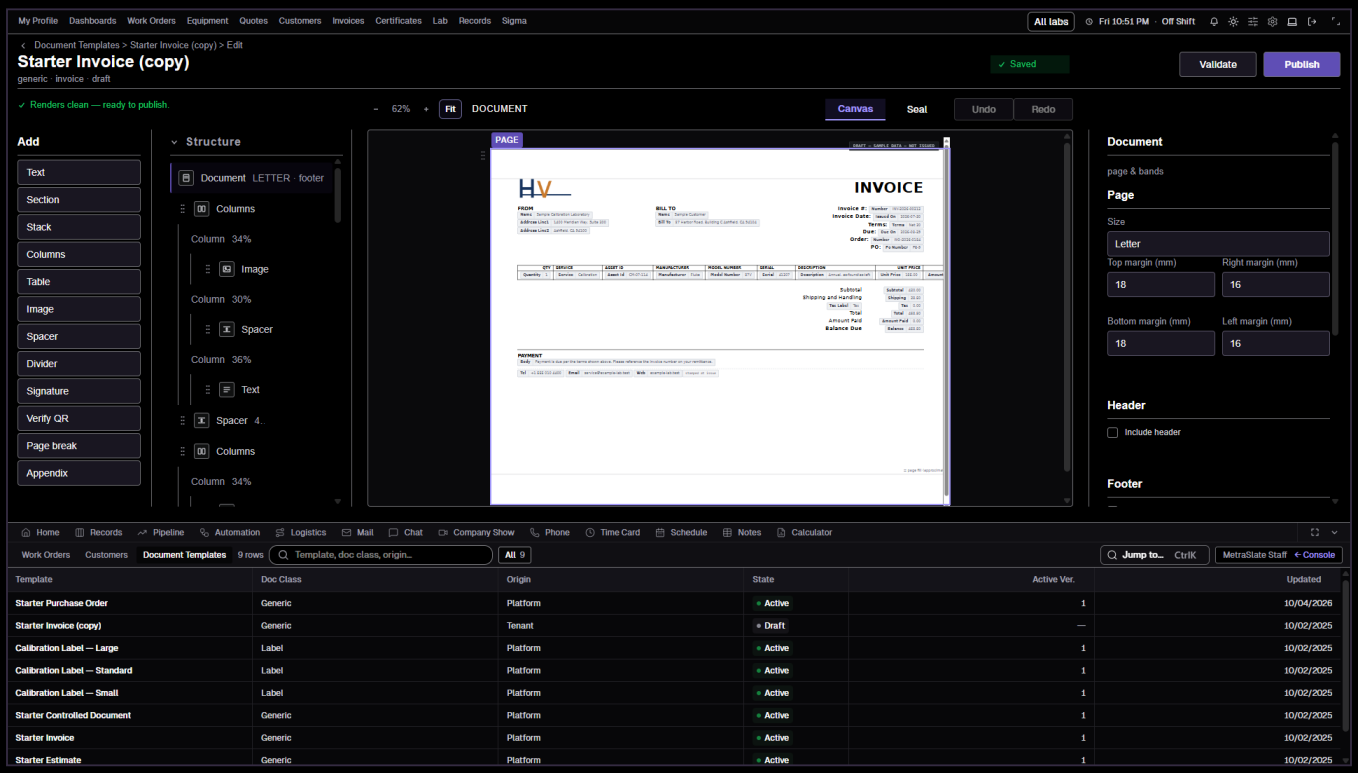

The buyer may keep existing laboratory software, combine an equipment or quality system with accounting and CRM, customize an ERP, or continue using spreadsheets. MetraSlate must show a better fit for the complete workflow and a credible transition path. A long feature list alone does not overcome migration cost, staff habits or procurement concerns.

Commercial evidence to build: qualified conversations, scoped opportunities, signed agreements, successful migrations, paid use, retention and customer-confirmed improvements.

IN THE PRODUCT / DOCUMENT CREATOR

Make the document part of the workflow.

Document Creator lets the organization compose reusable documents around record data, inspect the result and manage publication of the template.

Document Creator in Standard. A sample invoice template is open with its structure, page preview, document settings and validation and publishing controls.

Structure and data

Arrange sections, tables, text and other elements into a reusable document. Bound record fields and repeating rows carry business information into the output.

Preview before publication

Inspect the page and its configuration in the same workspace. The template has its own saved state and publication steps.

Useful beyond one document

Use the same approach for certificates and other business documents. Versioned templates let the organization control the format it issues to customers.

06 / COMPANY AND CAPITAL

Use investment to turn product breadth into adoption.

MetraSlate LLC is based in Portsmouth, Virginia. The company is bootstrapped, and its founder brings calibration and metrology experience and service as a US Navy veteran.

Current foundation

The product has a hosted demonstration environment and a working application covering laboratory and business workflows. Demonstrated scope includes customer and equipment records, work-order views, calibration records and retrieval of a released calibration certificate. The next commercial proof is sustained customer operation and paid adoption, supported by repeatable onboarding and service.

Customer onboarding	Fund data migration, configuration, training and the support needed for the first operating accounts. Milestone: a customer completes its agreed workflow using validated records and responsibilities.
Production operations	Strengthen deployment, monitoring, backup and recovery, incident response and operating ownership. Milestone: an agreed operating runbook and demonstrated recovery process for the customer deployment.
Product validation	Validate the complete customer workflow, permission boundaries, documents and relevant provider connections. Milestone: documented acceptance of the scoped operating process, including exceptions.
Repeatable sales	Build focused demonstration materials, a qualification process and a measurable opportunity pipeline. Milestone: signed commercial commitments and a repeatable route from first conversation to paid operation.
Organizational capacity	Reduce dependence on the founder through documentation, support capacity and appropriate engineering, operational and commercial coverage. Milestone: defined ownership beyond a single individual.

Financing discussion

The financing discussion will establish an amount and structure around a costed operating plan and measurable milestones. Priority goes to customer onboarding, reliable operations, product validation and repeatable sales. The supporting financial schedule should connect hiring and operating costs to runway and the customer milestones that investment is intended to achieve.

07 / INVESTMENT CONSIDERATIONS

Evaluate the product, the adoption and the execution.

The opportunity is a connected operating product with a specific first market. The investment decision also depends on customer demand, implementation economics, operating controls and the resources needed to deliver.

Adoption and switching	Customers already have records, tools and routines. Examine the implementation plan, migration evidence, training burden and reasons a buyer will change systems.
Breadth and execution	A wide product surface creates prioritization and support risk. Examine the customer workflow selected for launch, ownership of gaps and the sequence for adjacent products.
Technical and operational trust	Review tenant separation, access controls, calibration calculations, document integrity, backup and recovery, and external-provider dependencies. Request current evidence for the deployment being evaluated.
Founder concentration	Founder domain knowledge is valuable, but delivery cannot depend indefinitely on one person. Review documentation, continuity, hiring priorities and support coverage.
Commercial and financial proof	Separate current contracts and receipts from pipeline and projections. Review customer concentration, recurring revenue, implementation cost, provider cost, retention and cash needs as those figures develop.
Corporate diligence	Confirm ownership and assignment of intellectual property, entity structure, capitalization, contracts and proposed investment terms with current supporting documents.

The next investor conversation

Review a complete product workflow, the current commercial pipeline and a costed milestone plan. The useful question is how the next investment converts the existing product into successful customer operations and a repeatable business.
